Hi Marina,

Thanks for your mail, good news. =)

Find attached four H2O-cross section sets called A1, A2, B1 and B2

"A" means that I only use the cross sections for the J=0-1 rotational transition with an electron energy loss of 0.0023 eV.

"B" is similar to "A" but I use an electron energy loss of 0.005 eV.

"1" means that I use the cross sections for electronic excitations from Thorn (2008, PhD-thesis)

"2" is similar to "1" but with all cross sections for electronic excitations increased by a factor of 5.

As for the latter I changed
"1 <- Multiplication factor for cross section"
to
"5 <- Multiplication factor for cross section"
for all electronic excitation processes.

Let me know if you spot something strange or erroneous in the files and let me also know if you retrieve some interesting results. I will look for mistakes and then prepare the additional model files (where I will treat the rotational excitations in different manners).

Cheers/

Erik

Hi Erik,

Just a short message to tell you that Panayotis confirmed that the " ' " was a typo after all, as he retrieved the info on N2 b^1 Pi_u from Itikawa (2006).

Cheers,
Marina.
